

Day - 3: API Integration Report

Api Integration Process

Overview:

During Day 3, we focused on integrating APIs to establish seamless communication between the frontend, backend, and Sanity CMS. The integration ensured dynamic data retrieval and updates while maintaining performance and scalability.

Steps:

1. Identified the required API endpoints for data handling (e.g., fetching products, orders, and user details).
2. Configured API routes in the Next.js application to interact with Sanity CMS.
3. Debugged and tested API calls to verify successful data flow between components.

Schema Adjustments

Adjustments Made:

1. Modified the "Product" schema to include additional fields like "tags" and "category" for better filtering.
2. Updated the "Order" schema to store additional information..
3. Ensured all fields had appropriate validation rules to maintain data consistency.

Migration Steps and Tools Used

Migration Steps:

1. Clone the given repository of migration script.
2. Create Sanity project in my Avion website project.
3. Generate token of Sanity project.
4. Replace Token and Project id with avion sanity project's token and projectId in migration script.
5. Compile ts file and run.

6. Migration Completed.

Tools Used:

- Sanity CLI for schema updates.
- Migration script.

Screenshots

1. API Calls:

  _id: 'product-7'
}
```

2. Data Displayed on Frontend:

New ceramics

Sleek Living
£300

Modern Serenity
£480

Reflective Haven
£300

The Lucky Lamp
£200

Code Snippets

API Integration Example:

```
const [productData, setProductData] = useState<product[] | []>([])
useEffect(() => {
  async function dataFetch() {
    const data = await client.fetch(`*_type == "product" &&
      ("popular products" in tags || "new ceramics" in tags){
        id,
        price,
        name,
        tags,
        "image" : image.asset->url
      }`)
    setProductData(data)
  }
  dataFetch()
}, [])
const popularProducts = productData.filter(item => item.tags.includes
("popular products"));
const newCeramics = productData.filter(item => item.tags.includes
("new ceramics"));
```

Conclusion:

Day 3 was pivotal in ensuring seamless API integration and data migration, with the foundation now successfully laid.
